

Hierarchy solution — how it works

Move from the per-manager agency interim model, configure who sees which cases, how teams and sub-tenants appear in dropdowns, how allocation works, and how we roll out phase by phase.

Tenant: Godrej

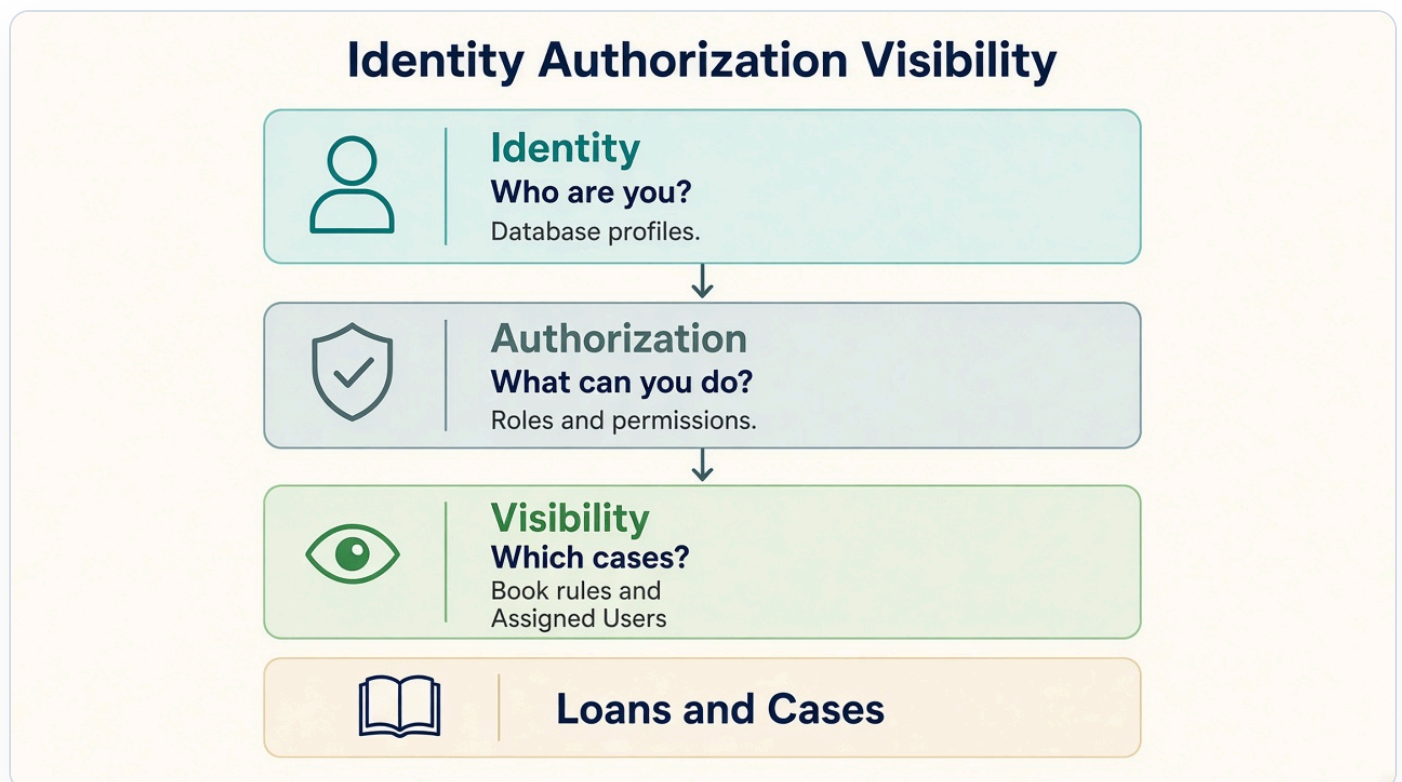

Identity: Database profiles

Branch: Optional / future-ready

Apps: Web · Manager · Field

Key flows

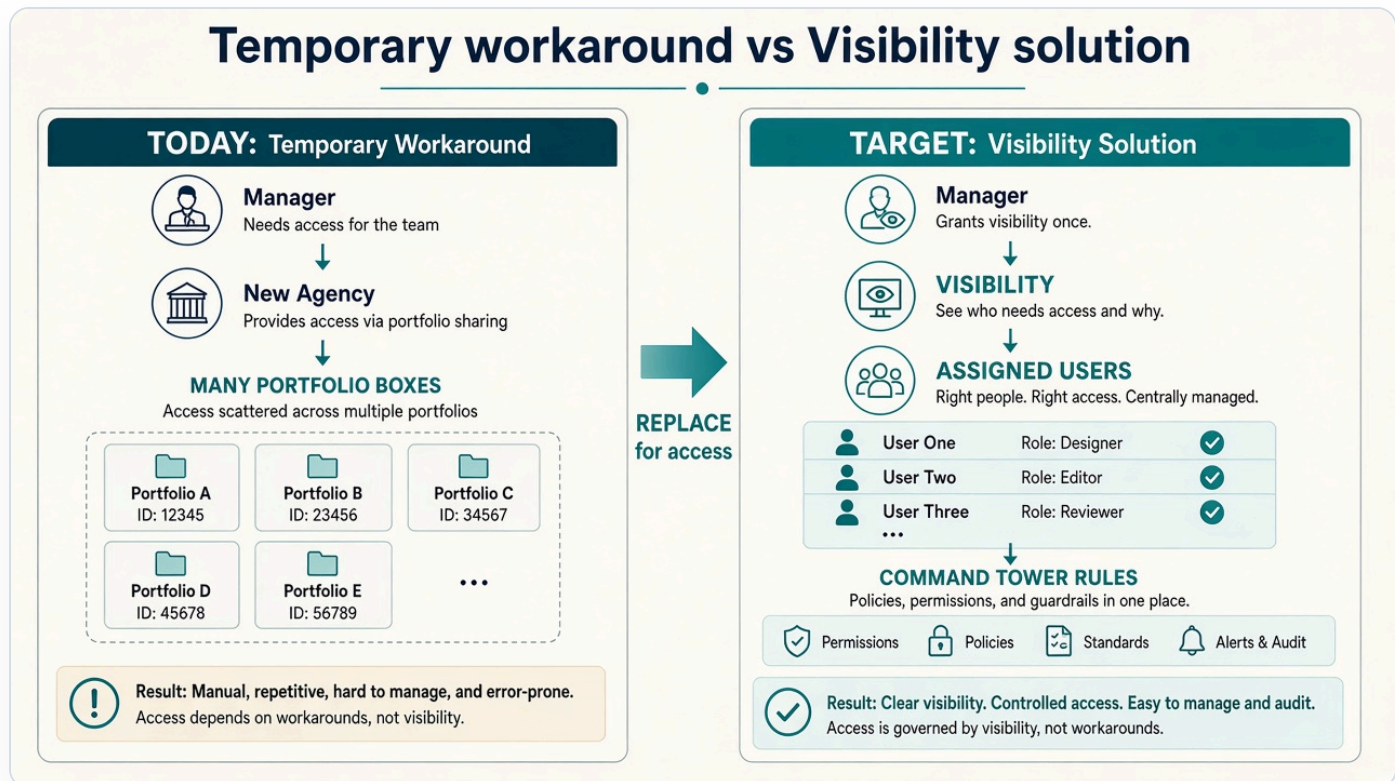

1. Three layers

Identity = who you are. **Authorization** = what you may do. **Visibility** = which loans appear.

ACCESS = Identity + Permission + Matching Visibility

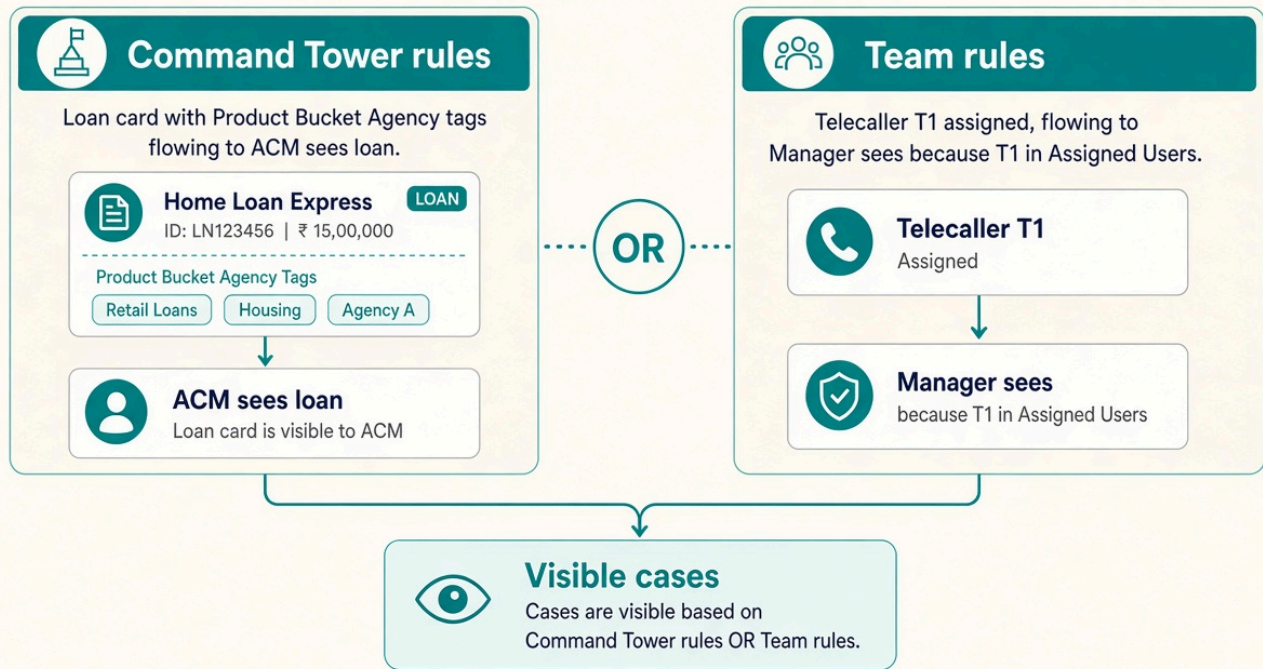

2. Today vs target

Today: agency per manager → portfolios multiply. Target: Visibility (team + Command Tower rules) — no agency-per-manager for access.

3. Command Tower rules vs team rules

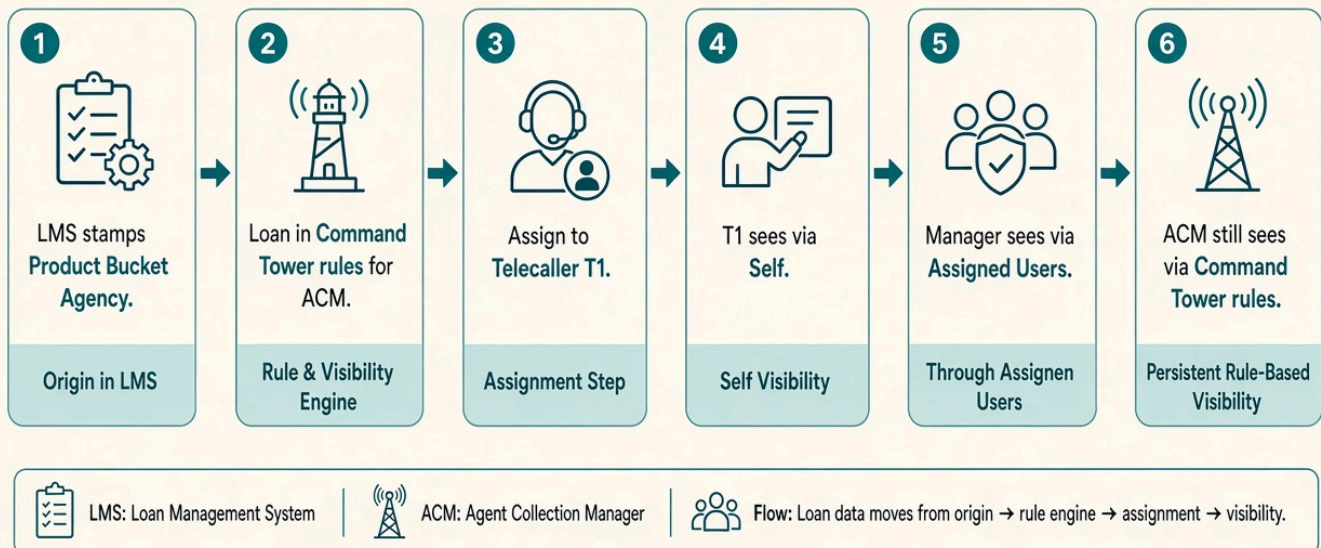

Command Tower rules vs Team rules

Command Tower rules = Product/Bucket/Agency on the loan (from CT map). **Team rules** = Assigned Users / Self.
Same user can have both (OR).

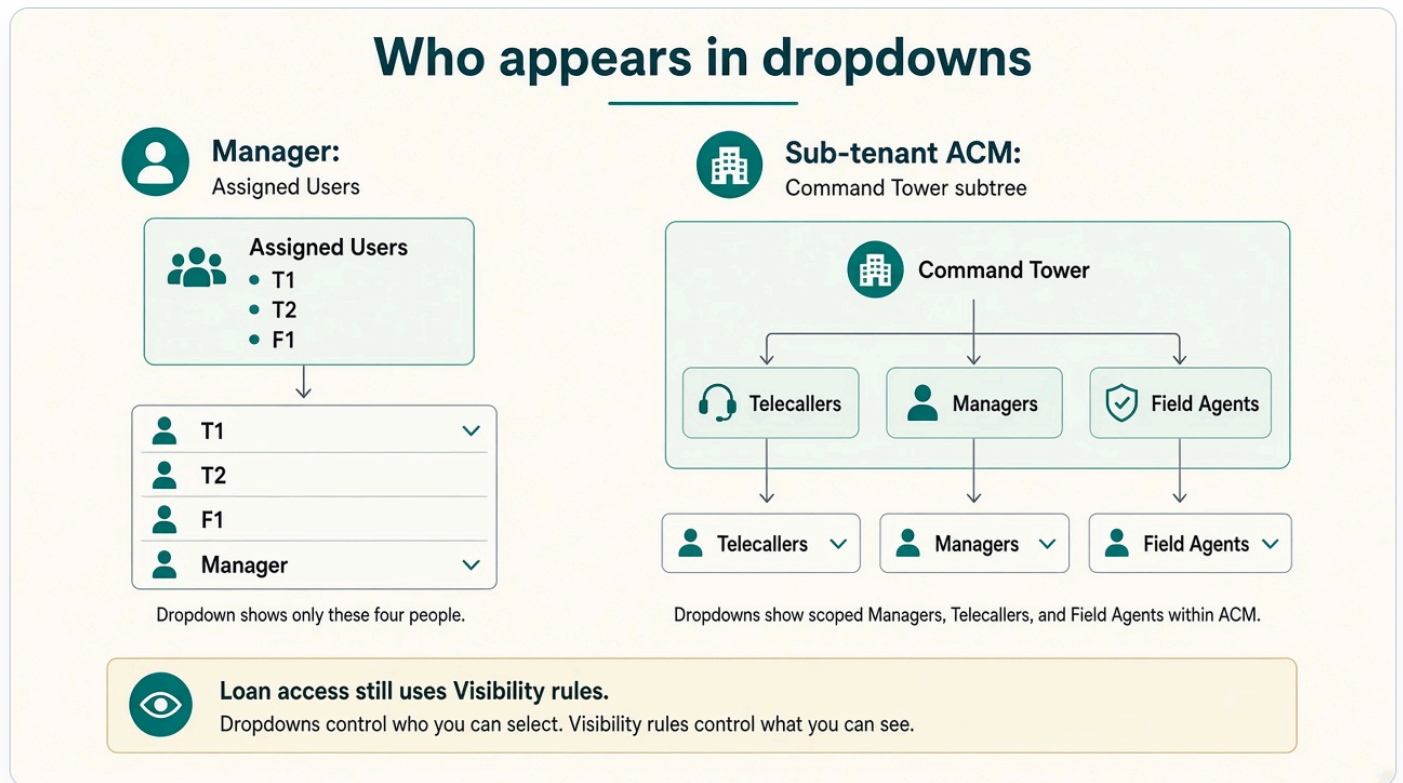

4. How a loan becomes visible after allocation

How a loan becomes visible

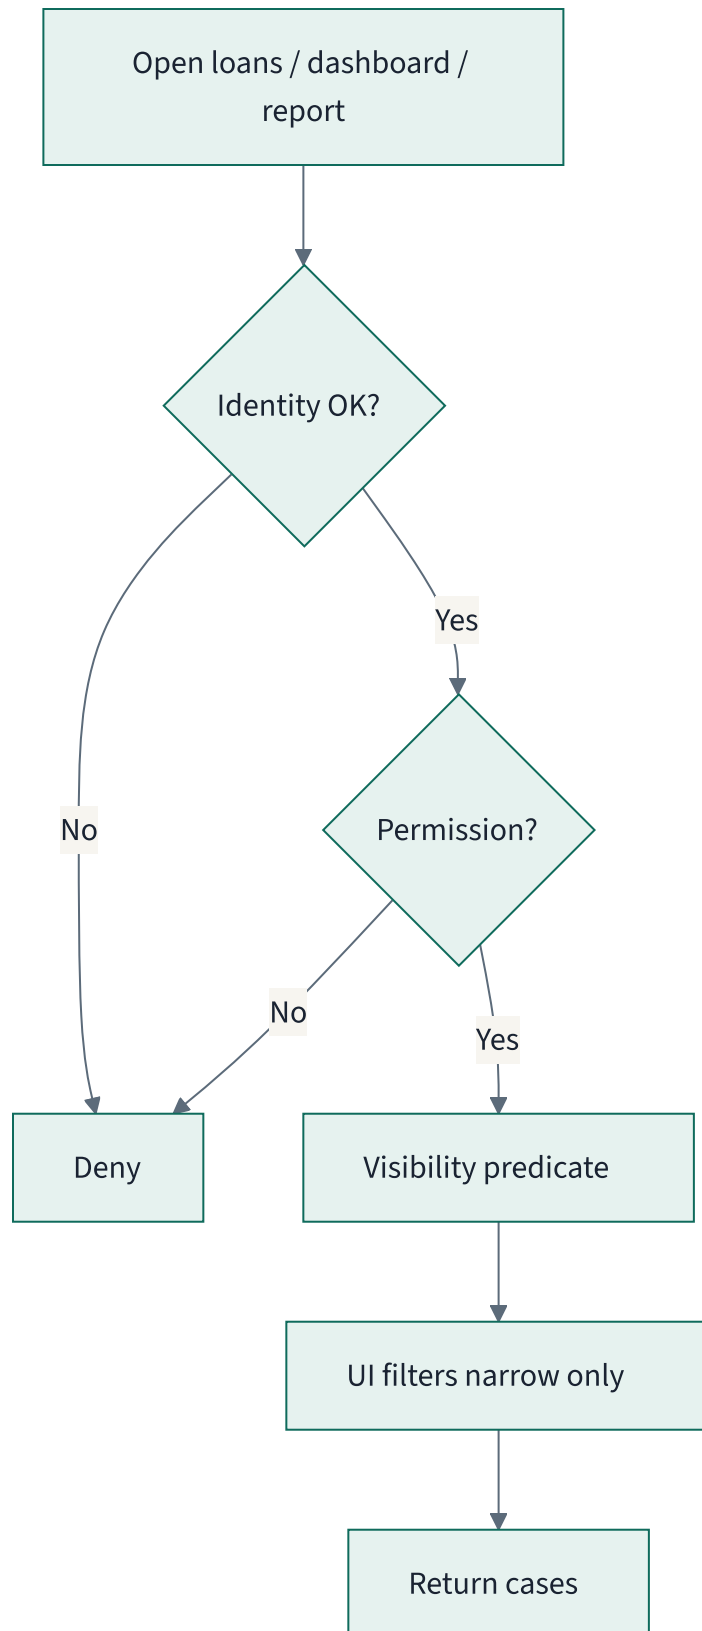

Assign the **worker only** (TC/FA). Managers/ACMs see via Visibility — not dual assignees on the loan. LMS = loan details only; Agency defaults to Inhouse.

5. Who appears in dropdowns

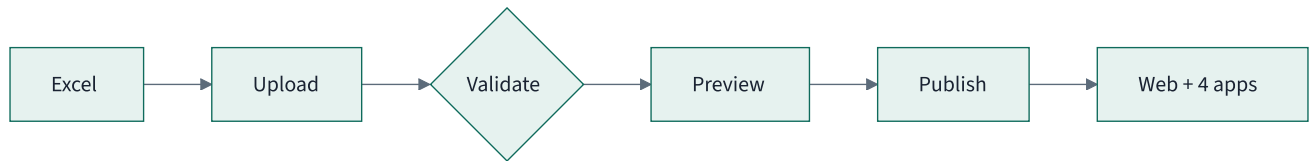

Manager = Assigned Users only. Sub-tenant = Command Tower scope + people resolver (+ direct Assigned Users if no manager).

6. Runtime check on every screen

7. Publish configuration

1. Executive summary

Godrej needs a clear collection hierarchy. Today an **interim model** creates a **separate agency for each manager**, so portfolios multiply as **managers × product/bucket**.

To solve this hierarchy issue for Godrej, we implement Identity, Authorization, and Visibility so the per-manager agency pattern is no longer required for access control.

Identity Authorization Visibility

Identity

Who are you?

Profiles and sessions in the **database**.

Authorization

What can you do?

Role → permissions.

Visibility

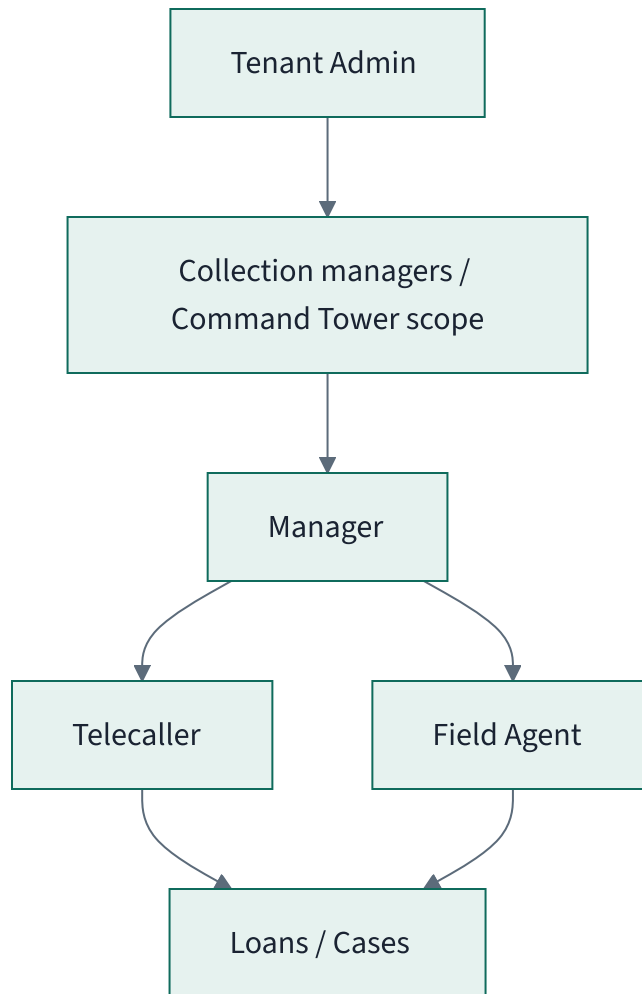

Which cases?

Command Tower rules + team rules + Self / All Cases.

ACCESS = Authenticated Identity + Required Permission + Matching
Visibility

2. Problem statement

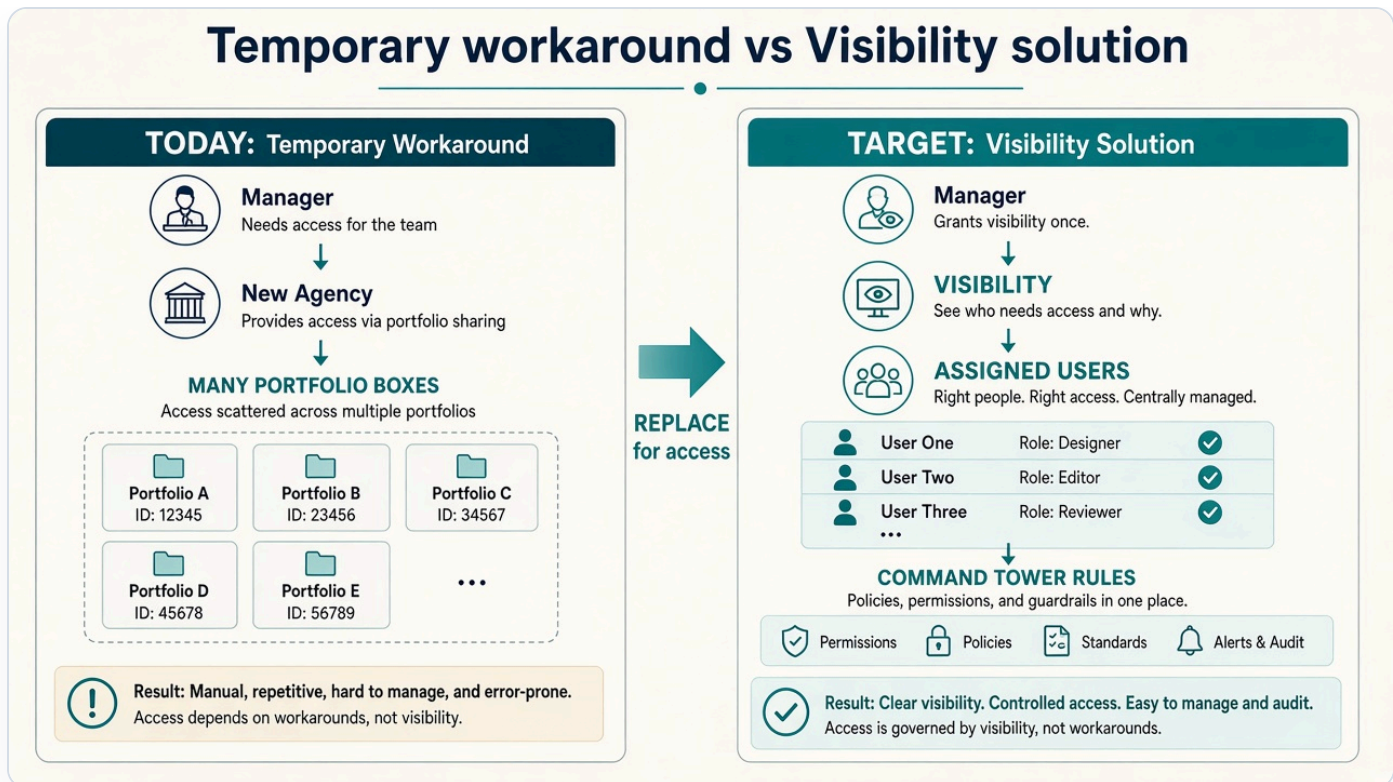

2.1 Intended Godrej hierarchy (business)

Business needs include: manager sees their team's cases; telecaller/field agent see assigned cases; admins see wider Command Tower scope; mixed product/bucket under one manager without inventing fake agencies.

2.2 Current interim model

Temporary workaround vs Visibility solution

Temporary solution: a separate agency is created for each manager so that manager's telecallers and field agents (and portfolios) sit under that agency.

MECHANISM	EFFECT
One agency per manager	Isolates each manager's team
Portfolio = Agency × Product × Bucket	Same product/bucket repeated under every manager agency
Net result	Managers × portfolios to create and maintain
Command Tower / CM filters	Often used alongside this to filter by Command Tower rules on web/reporting

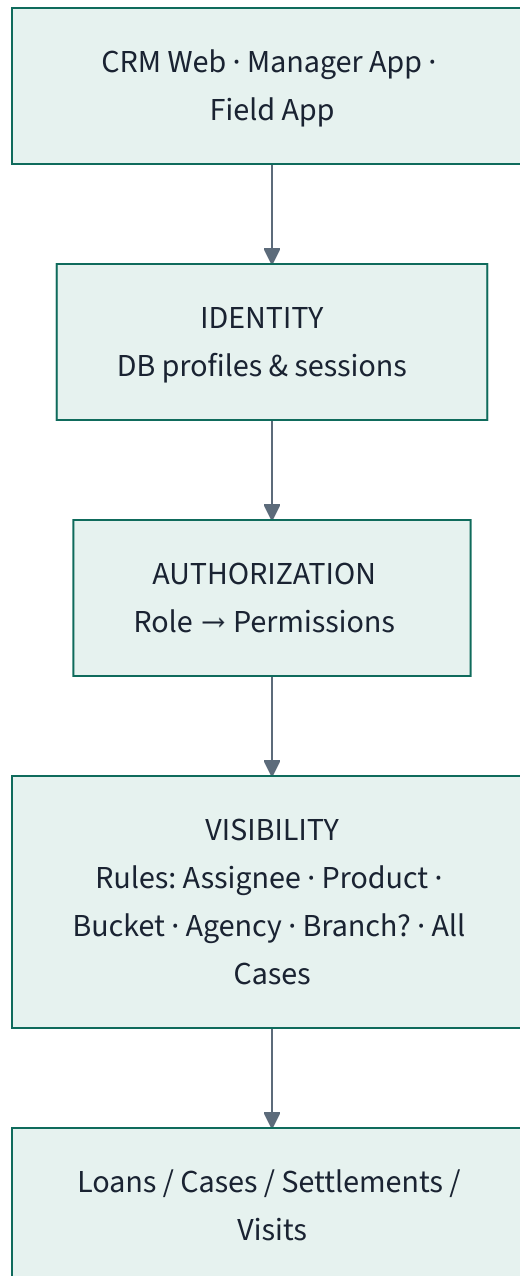

2.3 What breaks or becomes hard

- Onboarding a manager means agency + many portfolios + people membership
- Moving a telecaller/field agent means portfolio/agency maintenance
- Dashboards, loan lists, reports, and mobile apps all inherit the same structure
- LMS loan ingest (replacing import) must not recreate the same agency explosion

- No clean model for “this manager sees T1, T2, F1” without agency isolation

3. Solution architecture

Visibility is **configured case scope**, not “simulate hierarchy with agencies.” Hierarchy-like outcomes (manager team, Command Tower scope, admin all-cases) are expressed as rules.

3.1 Visibility rule semantics

PATTERN	MEANING	EXAMPLE
Same column, multiple values	OR	Bucket B1 B2
Different columns, one row	AND	Product PL AND Agency Inhouse
Multiple rows, same user	OR	Team assignees OR Command Tower product scope

3.2 Dimensions for Godrej

DIMENSION	GODREJ NOW	NOTES
Assignee	PRIMARY	Self for TC/FA; lists for managers
Product	PRIMARY	From LMS loan details
Bucket	PRIMARY	From LMS loan details
Agency	SUPPORTED	Default = Inhouse (not from LMS). Not one agency per manager. Future external agencies via Agency Allocation page
Branch	OPTIONAL	Not used by Godrej today; column present, non-mandatory
All Cases	ADMIN	Explicit tenant-wide for primary Tenant Admin

3.3 What this deliberately separates

Visibility (this solution)

Which loans appear on lists, dashboards, reports, mobile home screens.

Worker assignment

Who is allocated to work a loan (TC/FA). After assign, SELF visibility applies.

Agency allocation

Which agency owns the loan. Default **Inhouse**. New page for future external agencies — not driven by LMS.

LMS boundary: LMS sends **loan details only** (product, bucket, balances, customer fields, etc.). It does **not** allocate agency. Agency is set in Collekt: **Inhouse by default**; when Godrej later onboards an external agency, ops use the **Agency Allocation** page to move loans to that agency. Today's multi-agency setup exists only because of the per-manager agency interim model — that goes away with Visibility.

4. Implementations & flows this solves

FLOW / MODULE	PROBLEM TODAY	HOW THE SOLUTION FIXES IT
Manager onboarding	New agency + portfolios per product/bucket	Create manager profile + visibility rows (Assigned Users / Product+Bucket)
TC / FA onboarding	Add to manager agency portfolios	Create profile + Self Assigned; optionally add to manager's Assigned Users
Loan list / All Cases	Scoped by portfolio membership / manager agency	Backend Visibility predicate on every query
Loan detail	May open cases outside intended Command Tower scope	Deny if case fails visibility
Dashboards	KPI totals follow wrong agency/portfolio set	Same visibility predicate on aggregates
Reports / MIS	Row scope tied to the interim hierarchy model	Report queries use Visibility Context
Filters (multi-select)	Agency/portfolio driven; inconsistent multi-select	Multi-select Product/Bucket/Agency/Assignee n visibility
Loan assignment	Confused with portfolio membership	Assign updates assignee; visibility SELF for worker; manager sees via Assigned Users
Settlement list / approve	Often portfolio-linked	Scope via loan visibility + permission to settle/approve
Field Agent app	Requires portfolioId as access key	SELF visibility; portfolio picker demoted
Manager app	Team loans via manager agency portfolios	Assigned Users / dimension rules
LMS loan ingest	Risk of recreating agency×portfolio explosion; agency tied to multi-agency interim model	LMS = loan details only; agency defaults to Inhouse ; no per-manager agency on ingest

FLOW / MODULE	PROBLEM TODAY	HOW THE SOLUTION FIXES IT
Agency allocation	Agency chosen via multi-agency / portfolio model today	New Agency Allocation page; keep Inhouse by default; assign to external agencies when Godrej brings them in
SMS / Payment callbacks	May assume portfolio/agency context	Operate on loan id; hierarchy not required for callback
Command Tower rules	Mixed as security + org map	CT remains org/reference; security = Visibility (seeded from CT where useful)

5. How user onboarding changes

5.1 Today (interim model)

1

Create agency for the manager

2

Create portfolios for each Product × Bucket under that agency

3

Create manager / TC / FA profiles under that agency

4

Attach people to portfolios so they can see loans

5.2 Target onboarding (Visibility model)

1

Identity: Create user in database with role (Tenant Admin / Manager / Telecaller / Field Agent / ...)

2

Authorization: Role grants permissions (what screens/actions)

3

Visibility: Add rule rows for that user (Self / Assigned Users / Product+Bucket / Agency / All Cases)

4

Publish: Validate and activate visibility version — user can now see the correct cases

5.3 Role-wise onboarding checklist

ROLE	CREATE PROFILE	VISIBILITY SEED	NO LONGER REQUIRED
Primary Tenant Admin	Yes	All Cases = Yes	—
Manager	Yes (shared/inhouse agency ok)	Assigned Users = their TC/FA; Product+Bucket (+ Agency Inhouse) required if they allocate unassigned loans	RETIRE dedicated agency + portfolio fan-out
Telecaller	Yes	Self Assigned = Yes; ensure manager's Assigned Users includes them	Membership on many portfolios for access
Field Agent	Yes	Self Assigned = Yes; ensure manager's Assigned Users includes them	Portfolio picker as security
Area / Command Tower admin (NCM/ZCM/RCM/ACM style)	Yes + permissions	Product/Bucket/Agency (and later Branch) rows = Command Tower rules for their scope	Assuming title alone grants loan filter

Default automation: on create of Telecaller / Field Agent, system auto-adds *Self Assigned = Yes* into a draft visibility set (still published with audit). Manager team links are maintained via Assigned Users on the manager's rules.

Managers who allocate: Assigned Users alone only shows loans already assigned to that manager's TC/FA. Unassigned loans have no assignee, so they never match Assigned Users. A manager who needs to pick up and allocate unassigned loans **must** also have **Product + Bucket** (and typically Agency = Inhouse) Command Tower rule rows — otherwise they cannot see those loans to assign them. Assigned Users-only is enough only for managers who only supervise already-assigned team work.

5A. Who appears in dropdowns — Managers vs Sub-tenant roles

There are two related but different questions:

Case visibility

Which **loans/cases** appear on lists, dashboards, and reports.

People visibility (dropdowns)

Which **managers / telecallers / field agents** appear when a user opens a filter or assignment dropdown.

Both are driven by configuration — not by creating a separate agency per manager. Case visibility uses Visibility rules. People dropdowns use the **team roster** derived from those rules and, for sub-tenant roles, from **Command Tower rules**.

5A.1 Manager — only assigned telecallers & field agents

Who appears in dropdowns

Manager:
Assigned Users

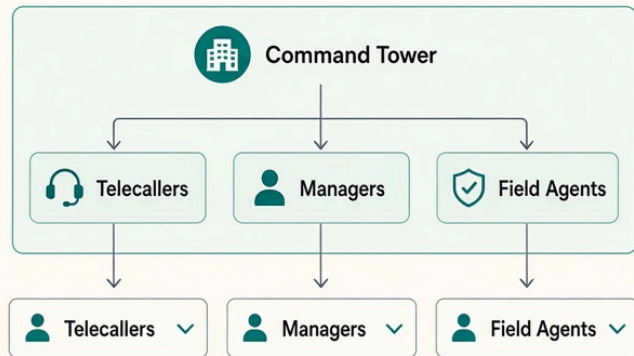

Dropdown menu showing selected users:

- T1
- T2
- F1
- Manager

Dropdown shows only these four people.

Sub-tenant ACM:
Command Tower subtree

Dropdowns show scoped Managers, Telecallers, and Field Agents within ACM.

Loan access still uses Visibility rules.

Dropdowns control who you can select. Visibility rules control what you can see.

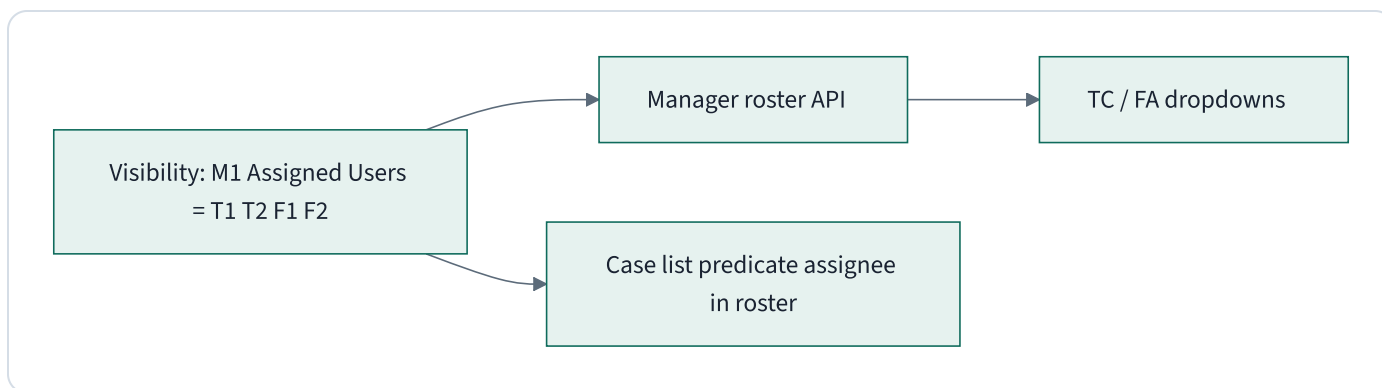

Rule: A manager's TC/FA dropdowns show *only* the users listed in that manager's Visibility **Assigned Users** configuration — not every telecaller/field agent in the tenant.

How it is configured

USER ID	ASSIGNED USERS	SELF	MEANING
M1	T1 T2 F1 F2		M1's team roster = T1, T2, F1, F2
T1		Y	T1 sees only self-assigned cases
F1		Y	F1 sees only self-assigned cases

What the manager sees where

SURFACE	BEHAVIOUR
Telecaller dropdown (filters / assign / reports)	Only T1, T2 (from M1 Assigned Users who are telecallers)
Field Agent dropdown	Only F1, F2
Loan list / Manager App team loans	Assigned team work: assignee $\in \{T1, T2, F1, F2\}$. Unassigned pool (to allocate): only if M1 also has Product+Bucket (+ Agency) Command Tower rows — Assigned Users alone cannot surface unassigned loans.
Another manager M2	Does not see T1/T2/F1/F2 unless those ids are also on M2's Assigned Users

How the roster is loaded at runtime

- 1 Manager logs in → Identity resolves profile M1.
- 2 System loads M1's **active Visibility rules** and reads **Assigned Users**.
- 3 Roster API returns only those profile ids, split by role (Telecaller vs Field Agent).
- 4 UI dropdowns bind to that roster. No portfolio membership and no “all users in my agency” query.

Adding or removing someone from a manager's team

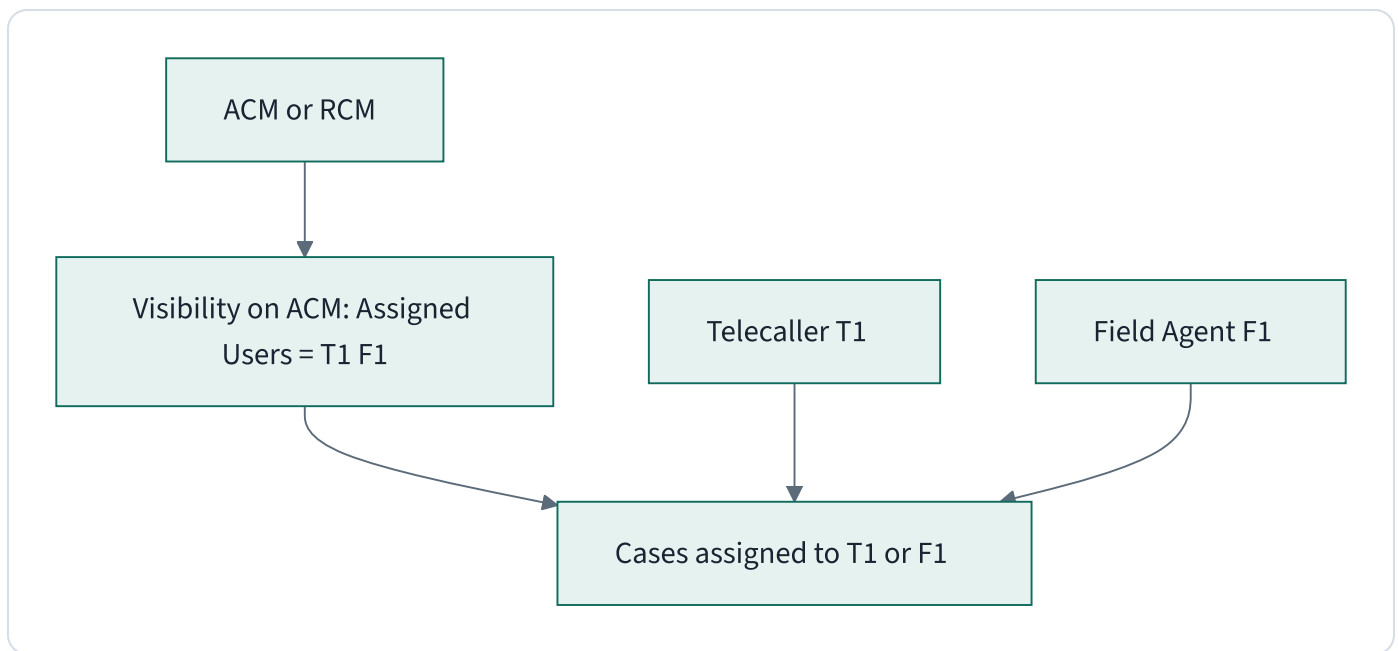

- **Add:** put the TC/FA id into M1's Assigned Users → publish Visibility → dropdown and case scope update together.
- **Remove:** delete id from Assigned Users → publish → they disappear from M1's dropdowns and from M1's assignee-based case scope.
- TC/FA keep **Self** visibility for their own cases regardless of which manager lists them.

Multi-manager teams: If both M1 and M2 must supervise the same people, list the same TC/FA ids on both managers' Assigned Users rows. That replaces sharing one agency.

Direct report to ACM / RCM (no manager in between)

Yes — this is supported. **Assigned Users is not limited to the Manager role.** A telecaller or field agent can report directly to an ACM or RCM (or ZCM/NCM) without a manager profile.

NEED	HOW IT IS CONFIGURED
ACM/RCM sees those people's cases	On ACM/RCM Visibility: Assigned Users = T1 F1 ... (same column as for managers)
ACM/RCM sees those people in dropdowns	People resolver includes profiles listed on that CM's Assigned Users <i>and/or</i> mapped under their Command Tower scope without requiring a manager node
TC/FA own app / lists	Still Self Assigned = Y — unchanged
Optional Command Tower rules overlap	ACM can also keep Command Tower rules (Product/Bucket/Agency from CT); Assigned Users covers the direct-report people path

- **Solved:** no need to invent a dummy manager or a per-manager agency just to hang TC/FA under ACM/RCM.
- **Mixed teams:** same ACM can have some people via managers (CT scope → manager → Assigned Users) and some via direct Assigned Users on the ACM.
- **Command Tower:** may still map ACM → Agency → Product/Bucket for the Command Tower scope; people without a manager are attached via Visibility Assigned Users on the ACM/RCM, not forced through a manager row in CT.

5A.2 Sub-tenant roles (NCM / ZCM / RCM / ACM) — dropdowns & Command Tower

Sub-tenant users are Tenant Admin-class profiles with a Command Tower scope (often aligned to NCM → ZCM → RCM → ACM). They need dropdowns for **child CMs, managers, telecallers, and field agents** that sit under their Command Tower scope — not the entire tenant directory.

What Command Tower contributes

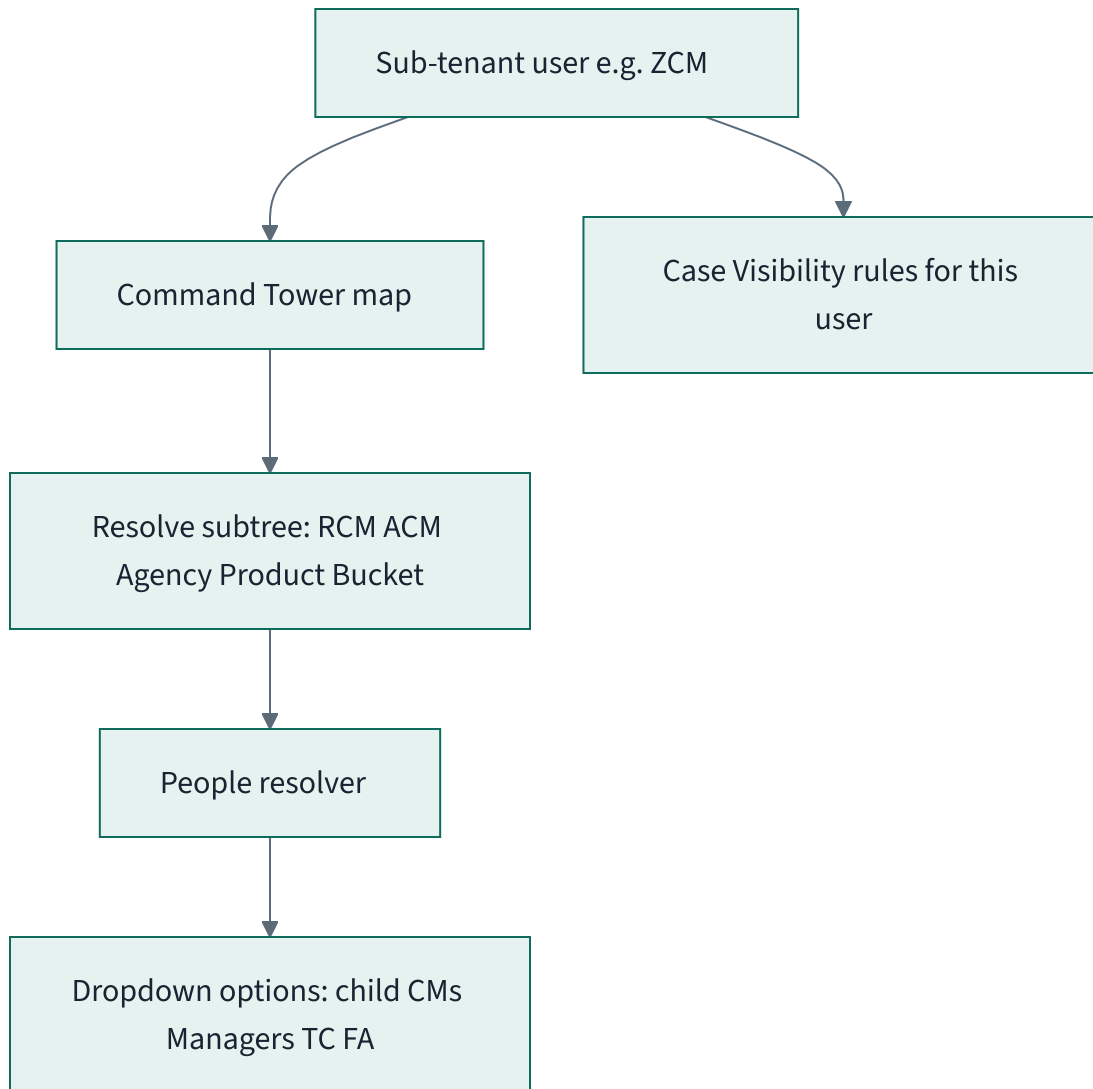

Command Tower stores the org map, for example:

NCM → ZCM → RCM → ACM → Agency → Product → Bucket

For a logged-in sub-tenant user, Command Tower answers: *“Which agencies / products / buckets (and child CM ids) sit under my node?”*

How dropdown population works by sub-role

LOGGED-IN SUB-ROLE	COMMAND TOWER SCOPE	DROPDOWNS THEY SEE
NCM	All ZCMs (and below) under this NCM in CT	ZCM list from CT; RCM / ACM cascaded from selected ZCM; Managers / TC / FA = profiles whose work sits in agencies / Command Tower scope under that CT subtree
ZCM	RCMs under this ZCM	RCM → ACM cascade; Managers / TC / FA under that subtree only
RCM	ACMs under this RCM	ACM list; Managers / TC / FA under those ACMs' agencies / Command Tower scope
ACM	Agencies (and product/bucket) under this ACM	Managers / TC / FA linked to those agencies or to managers in that Command Tower scope — not tenant-wide
Primary Tenant Admin (no sub-role)	Full CT optional for filters	Can load full NCM→... cascade and wider people search (still subject to All Cases for <i>loans</i>)

Two-step resolve (important)

- 1 Scope from Command Tower:** from the logged-in CM id, read CT to get child CM ids + Agency (+ Product/Bucket) set for that subtree.
- 2 People from profiles:** return Managers / Telecallers / Field Agents in that Command Tower scope — (a) managers under the CT agencies, (b) TC/FA on those managers' Assigned Users, and (c) TC/FA listed **directly** on the logged-in CM's Assigned Users (no manager required).
- 3 Cases from Visibility:** loan lists for the sub-tenant still use their published Visibility rules (often Agency/Product/Bucket Command Tower rules seeded from the same CT map).

Selecting a person in a dropdown only *narrows* further; it cannot expand beyond Visibility.

Example

USER	CT SAYS	DROPDOWN RESULT	CASES
ZCM-West	RCM-North, RCM-South → ACM-A, ACM-B → Agency Inhouse + Product PL...	Only those RCMs/ACMs; managers M1,M2 in that Command Tower scope; TC/FA on M1/M2 teams	Visibility rules for ZCM-West (seeded from same agencies/products/buckets)
ACM-A	Agency set under ACM-A only	Managers/TC/FA in ACM-A Command Tower scope only — not RCM-South's people	Narrower Command Tower rules

Cascade behaviour in UI (multi-select)

- NCM selects one or more ZCMs → RCM options reload from CT under those ZCMs
- RCM selection → ACM options reload
- ACM / agency selection → Manager and TC/FA dropdowns reload from the people resolver
- All cascades are scoped to the logged-in sub-tenant's CT subtree (they never see another NCM's tree)

5A.3 Summary matrix

VIEWER	TC/FA IN DROPDOWN	MANAGERS IN DROPDOWN	CHILD CMS IN DROPDOWN	SOURCE OF TRUTH
Manager	Only Assigned Users	Usually N/A or limited	N/A	Visibility Assigned Users
ACM / RCM / ZCM / NCM	TC/FA under their Command Tower scope	Managers under their Command Tower scope	Child CMs from CT cascade	Command Tower subtree + people resolver
Primary Tenant Admin	Configurable / wider	Wider	Full CT cascade optional	Admin scope + CT for filters

Security reminder: Dropdown membership controls *who you can pick*. Loan rows are still enforced by Visibility. A crafted API call cannot fetch cases outside Visibility even if someone guesses another user's id.

6. How hierarchy / visibility data is input

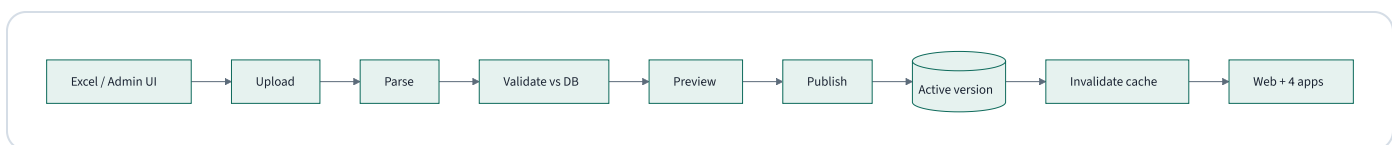

Business users do not maintain policy engines. They maintain a workbook (and/or admin UI that produces the same model).

6.1 Visibility workbook (primary input)

USER ID	BRANCH	PRODUCT	BUCKET	AGENCY	ASSIGNED USERS	SELF	ALL CASES
ADMIN1	<i>optional</i>						Y
M1					T1 T2 F1 F2		
M1		PL	B1 B2	INHOUSE			
T1						Y	
F1						Y	
ACM1				AG_A AG_B			

For Godrej today, leave **Branch** blank. Column remains so Branch can be enabled later without redesign.

6.2 Ingest pipeline

- Validate: user exists, product/bucket/agency exist, assigned users exist
- Branch: if blank → ignored; if filled → must exist when Branch master is enabled
- Nothing goes live until full-file validation succeeds

- Each publish creates a version (ACTIVE / PREVIOUS) for audit and rollback

6.3 Other inputs that feed hierarchy behaviour

INPUT	SOURCE	USED FOR
User profile + role	CRM registration (DB)	Identity + Authorization
Visibility rules	Excel / Visibility Admin	Case scope
Loan attributes	LMS sync (loan details) + Agency Allocation	Match Product/Bucket/Agency/(Branch)/Assignee — Agency defaults Inhouse, not from LMS
Command Tower map	Existing CT / SEAM uploads	Org reference + optional seed of Command Tower rules
Assignment actions	Allocator / manager in CRM or app	Updates assignee → SELF visibility

7. How Command Tower is taken into account

Position: Command Tower remains Godrej's *organisational / mapping* artefact (NCM → ZCM → RCM → ACM → Agency → Product → Bucket). It is **not** the runtime security engine. Visibility rules are the runtime security engine.

7.1 Roles of the two systems

Command Tower

- Org / Command Tower map
- Useful for reporting drill-downs and ops reference
- Can inform *what* Product/Bucket/Agency belong to a CM Command Tower scope
- May continue to be uploaded/maintained as today for reporting

Visibility Service

- Authoritative for “which cases can this user access?”
- Enforced on CRM, Manager App, Field App APIs
- Configured via Excel / Admin publish
- Fail closed; versioned; cached

7.2 How CT feeds the hierarchy solution

1

Discovery: Export current Command Tower mappings (CM → agencies → products/buckets).

2

Seed: Generate Visibility workbook rows for CM/manager users from CT (Agency / Product / Bucket sets).

3

Team rules: Add Manager Assigned Users from current manager ↔ TC/FA relationships (not from CT alone).

4

Cut over: Loan/dashboard/report APIs enforce Visibility. CT filters on UI become optional convenience only.

5

Steady state: Day-2 access changes go through Visibility publish. CT updates for org analytics can continue in parallel without granting access by themselves.

7.3 Command Tower and people dropdowns (sub-tenant)

For sub-tenant roles, Command Tower is the **directory scope** for cascading filters and for deciding which managers / telecallers / field agents appear in dropdowns (see [§5A](#)). Visibility remains the **case scope**.

NEED	USE COMMAND TOWER?	USE VISIBILITY?
Which ZCM/RCM/ACM options to show	Yes — cascade from logged-in CM	No
Which agencies/products/buckets are in my Command Tower scope	Yes — map	Also seeded into Visibility for case queries
Which TC/FA appear for a manager	No	Yes — Assigned Users
Which TC/FA/managers appear for a ZCM/ACM	Yes — subtree → people resolver	Cases still Visibility
Which loans appear	Not as ACL	Yes — authoritative

7.4 What we will not do

- Will not make Command Tower the sole ACL for case lists
- Will not require CT sync on every page load for security of loan rows
- Will not block hierarchy go-live on rebuilding CT as a full hierarchy engine
- Will not show tenant-wide TC/FA lists to managers or to sub-tenants outside their Command Tower scope

If Godrej later wants automatic sync “CT change → Visibility draft,” that can be a later phase (integration), after the Visibility engine is live.

8. Branch dimension — non-mandatory for Godrej now

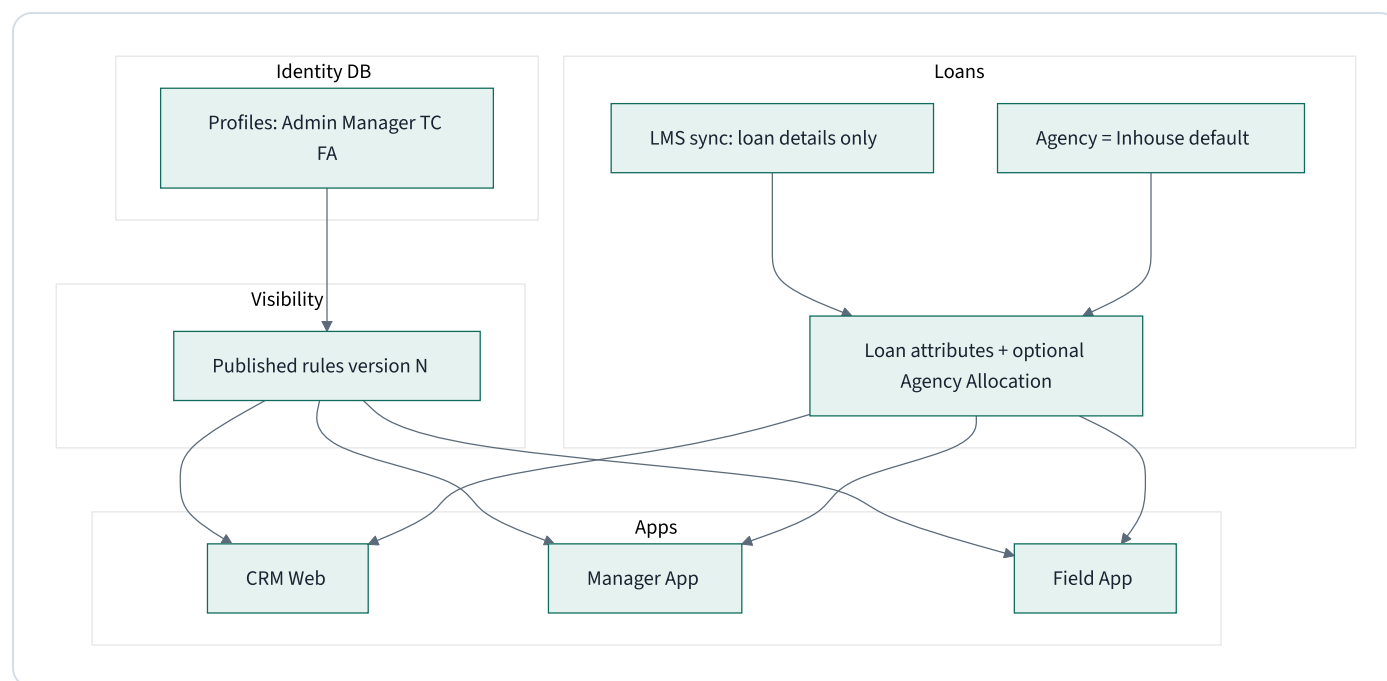

Godrej does **not** operate a branching model in Collektio today. The Visibility model still includes **Branch** as a first-class dimension in the workbook and data model so it can be enabled later without redesign.

ASPECT	NOW (GODREJ)	FUTURE (IF BRANCH ADOPTED)
Workbook column	Present, left blank	Filled with branch codes
Validation	Blank allowed	Value must exist in branch master
Loan attribute	Not required	LMS/sync stamps branch_id
UI filters	Hidden or disabled	Multi-select Branch filter
Visibility rules	Ignore empty Branch	AND with other dimensions as configured

Design principle: Branch is *optional infrastructure*, not a Godrej go-live dependency.

9. How the whole solution works for Godrej

9.1 Target operating picture

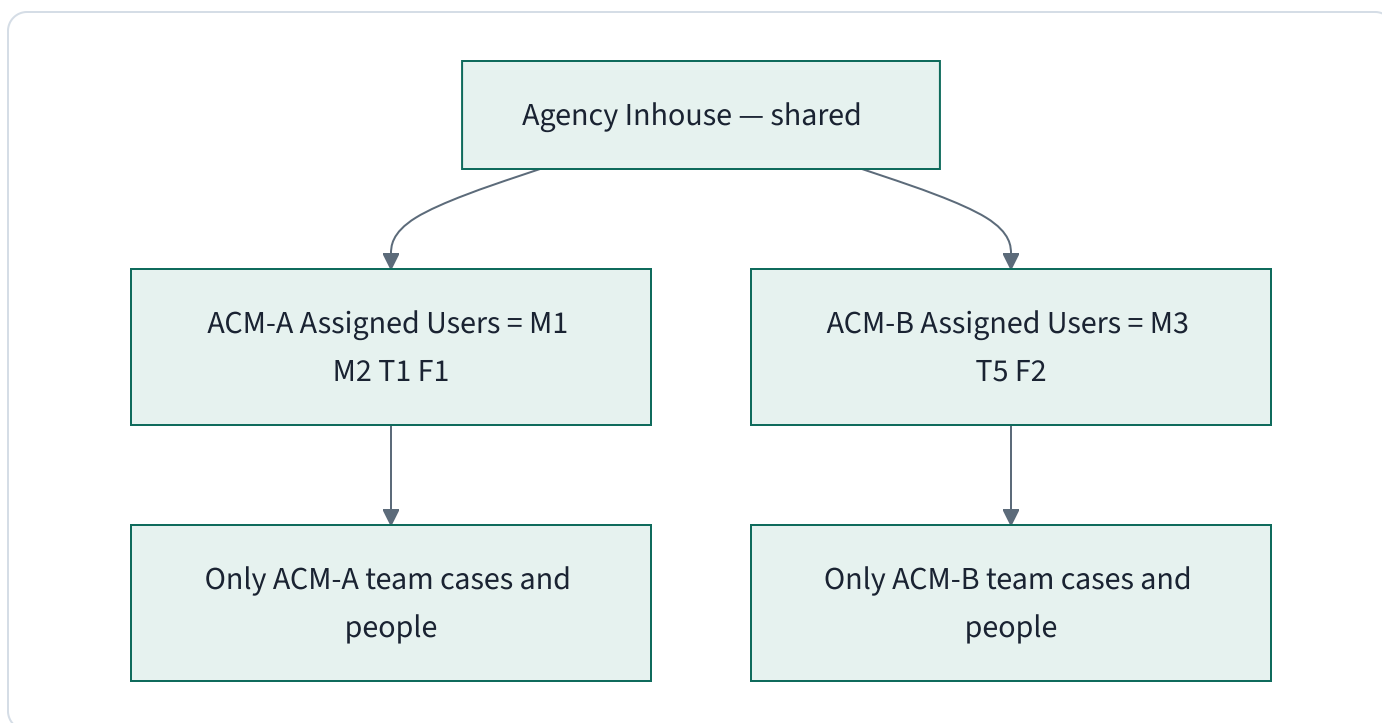

9.2 One agency (Inhouse) – ACM / manager scope

Godrej operates with **one agency: Inhouse**. All agents and managers sit under that agency. Agency is **not** used to isolate ACM or manager teams. Management scope comes from Visibility **Assigned Users**.

LAYER	GODREJ REALITY
Agency	One value — Inhouse — on (almost) every loan. Shared by everyone.
Who sees what	Visibility rules — mainly Assigned Users (and Self for TC/FA).
ACM management view	Only their assigned managers and/or TC/FA — configured on that ACM's Assigned Users list.
Manager team	Same pattern one level down: manager Assigned Users = their TC/FA.
Old interim	Separate agency per manager → RETIRE . Everyone stays under Inhouse.

Do not give an ACM only *Agency = Inhouse* (or tenant-wide Product/Bucket). With a single agency that is effectively everyone. For ACM management view, **Assigned Users is the primary scope**.

9.3 First-level allocation — who assigns, flow to agent

For Godrej day-1 ops, **first-level allocation = assign the loan to a worker (TC/FA)**. Agency is already Inhouse on LMS ingest — there is no agency hop in normal ops.

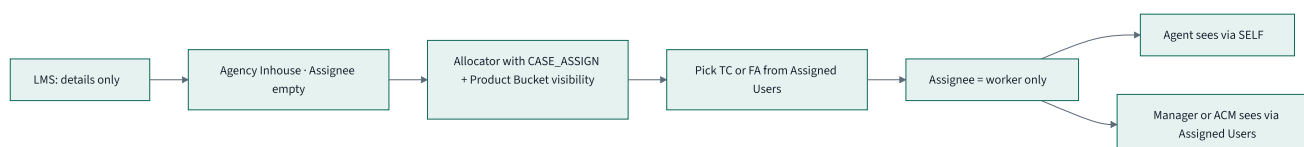

NEED	WHO	WHAT THEY MUST HAVE
Permission	Manager / ACM / Admin (whichever roles are granted)	Assign permission (e.g. CASE_ASSIGN)
See unassigned pool	Same person	Visibility Product + Bucket (+ Agency Inhouse) — Assigned Users alone cannot surface unassigned loans
Pick the worker	Same person	Assign dropdown = their Assigned Users roster only
Receive work	Telecaller / Field Agent	Self Assigned = Yes — they do not allocate the pool

1 LMS sync: loan details (product, bucket, ...); Agency = Inhouse; **Assignee empty** → unassigned pool.

2 Allocator (Manager or ACM with assign rights) opens CRM / Manager App → sees unassigned loans matching their Product+Bucket rules.

3 Assign: dropdown shows only their Assigned Users (TC/FA). Loan assignee stamped to the **worker only** — not dual-assignee with Manager/ACM.

4 After assign: agent sees via Self; their manager/ACM sees via Assigned Users; agent works disposition / visit / payment / settlement.

Not first-level allocation: Agency Allocation page (stays Inhouse for normal Godrej); Visibility publish (sets who may see / allocate — does not put a loan on an agent); putting ACM/Manager as loan assignee (they supervise via Visibility).

9.4 Day in the life

USER	OPENS	SYSTEM BEHAVIOUR
Field Agent	Pending / PTP / visits	Auth ok → Visibility SELF → only assigned loans
Telecaller	All Cases / dialer lists	Visibility SELF → assigned loans
Manager	Team loans / allocate / Manager App	Assigned Users for team cases; Product+Bucket (+ Agency) required to see unassigned loans to allocate
ACM	Management view / allocate (if granted)	Assigned Users = their managers and/or TC/FA only — not all of Inhouse; Product+Bucket if they allocate unassigned
Tenant Admin	Dashboards / reports	All Cases → full tenant (explicit)
Any user	Applies multi-select filters	Filters $\cap$ Visibility — never expands scope

9.5 What Godrej stops doing

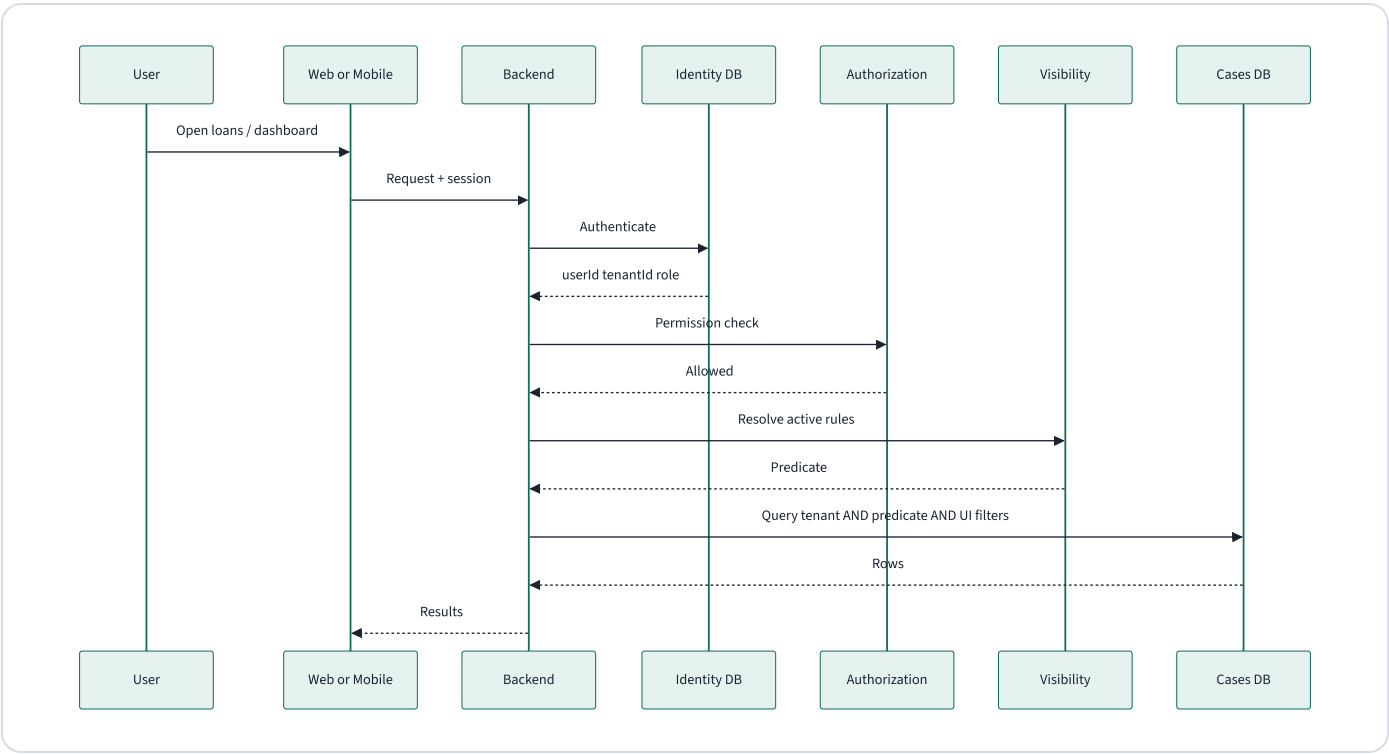

- Creating a new agency for every new manager (for access)
- Creating Product×Bucket portfolios under each manager agency only to grant access
- Treating portfolio membership as the ACL for people
- Using Agency = Inhouse alone to define ACM / manager management scope

9.6 What Godrej continues doing

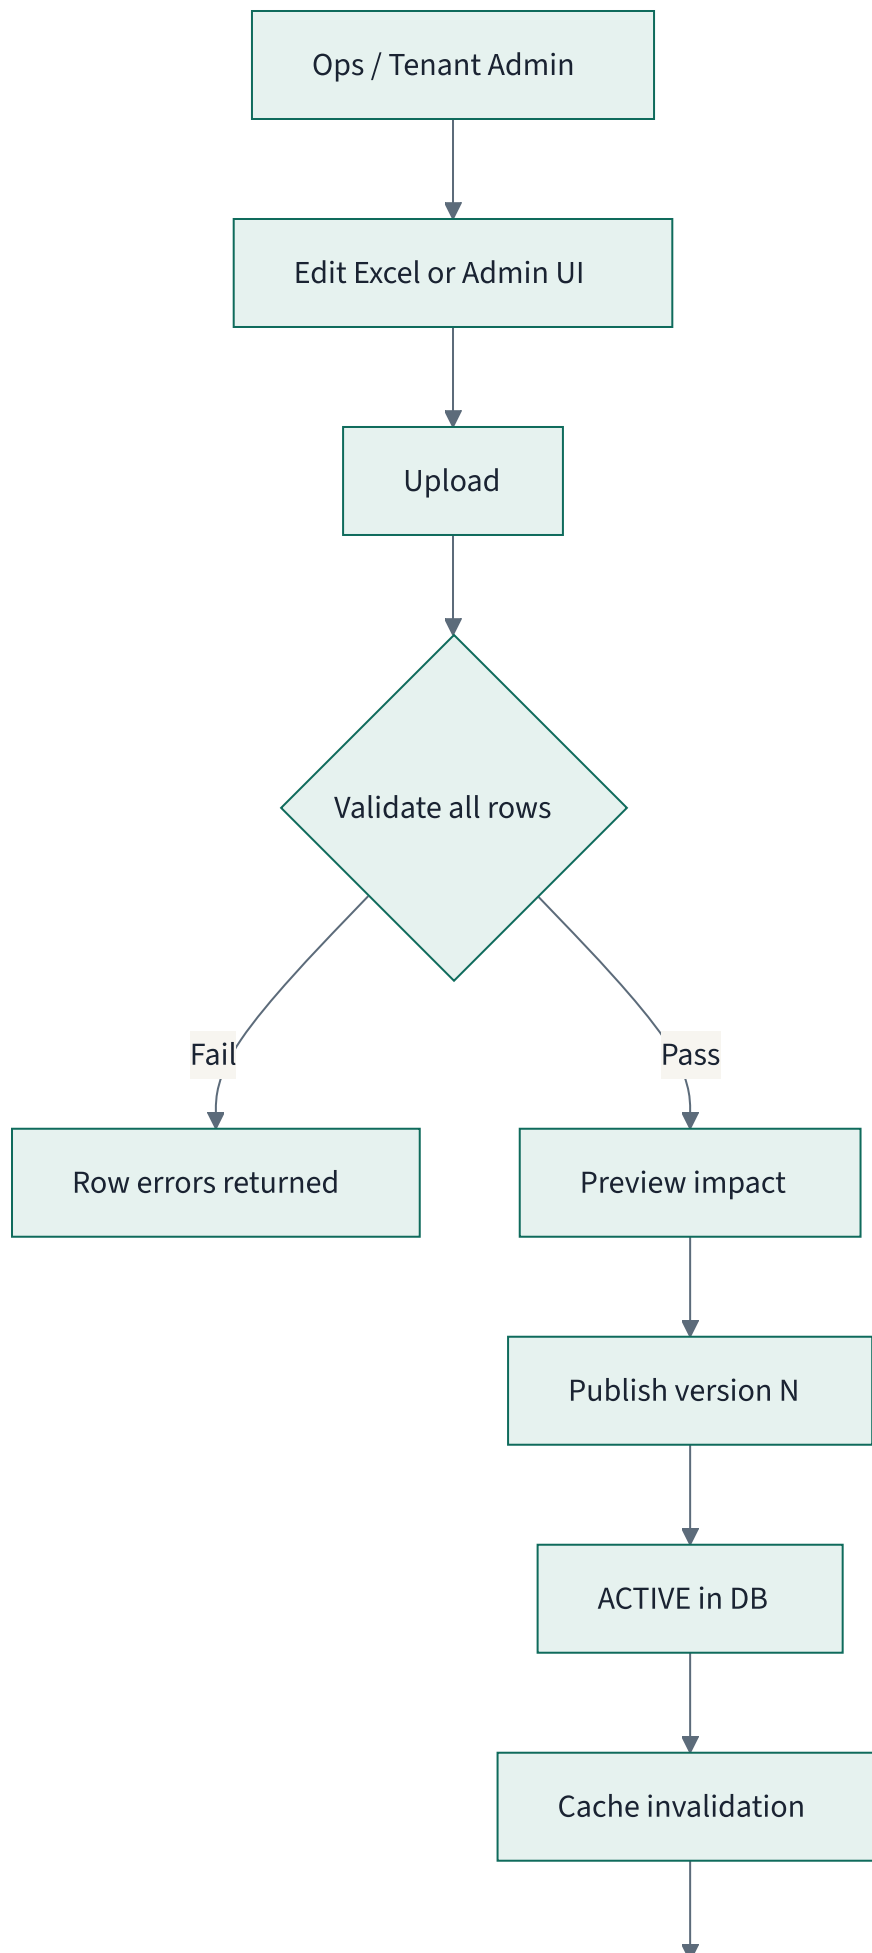

- Maintaining product/bucket masters
- Using LMS as loan-details source (replacing import) — agency not from LMS
- Assigning collectors/field agents to loans (first-level allocation)
- Keeping Agency = Inhouse by default; Agency Allocation page ready for future external agencies
- Optionally keeping Command Tower for org/reporting maps
- Publishing Visibility workbooks when teams or Command Tower rules change

10. Detailed operational flows

10.1 Runtime access (every list / detail / dashboard / report)

10.2 Publish visibility configuration

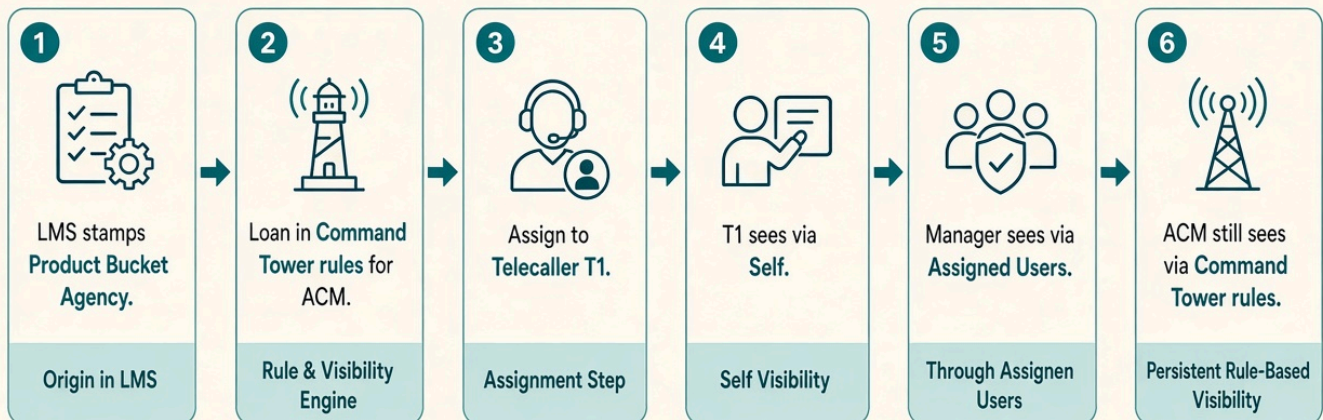

All apps use version N

10.3 Manager team change

- 1 Move telecaller T1 from manager M1 to M2 in ops process
- 2 Update Visibility: remove T1 from M1 Assigned Users; add T1 to M2
- 3 Publish → M1/M2 loan lists update; T1 SELF unchanged
- 4 No agency/portfolio recreation required for access

10.4 LMS loan arrives (replaces import)

How a loan becomes visible

LMS: Loan Management System

ACM: Agent Collection Manager

Flow: Loan data moves from origin → rule engine → assignment → visibility.

LMS scope: LMS provides **loan details only**. Agency is **not** allocated from LMS.

1

LMS upserts loan by external id with loan details (product, bucket, customer, balances, etc.)

2

Collekto sets **Agency = Inhouse** by default (no per-manager agency)

3

Assignee empty until worker assignment (TC/FA) in CRM / apps

4

Visible automatically to users whose Visibility rules match attributes / assignees

5

Do not create agencies or portfolios as part of LMS ingest

10.4a Agency Allocation page (new)

Today, Godrej runs a **multiple-agency model** as part of the per-manager interim model. With Visibility, that goes away for access: keep a single shared agency — **Inhouse** — as the default on loans.

1

Introduce an **Agency Allocation** page in CRM (separate from Visibility and from TC/FA assignment)

2

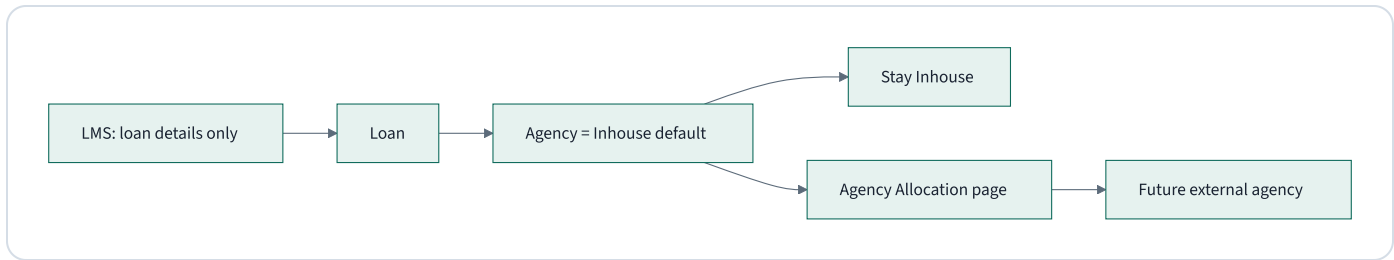

Steady state: loans stay on **Inhouse**; no allocation hop required for normal Godrej ops

3

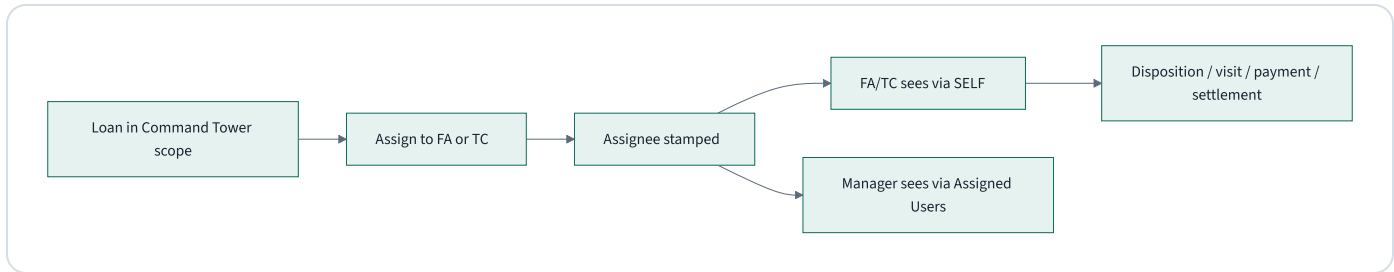

Future: if Godrej onboards an external agency, ops use Agency Allocation to move selected loans to that agency

4

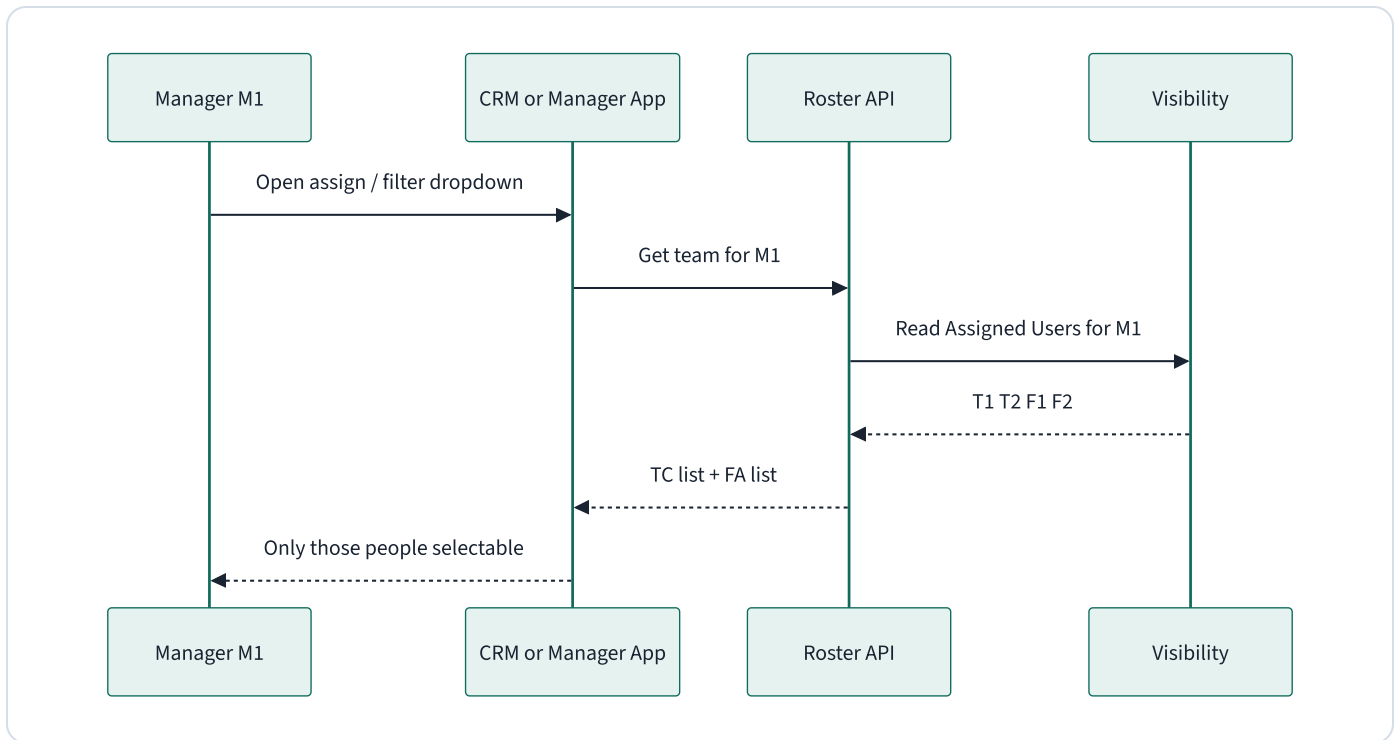

Visibility Command Tower rules can still match on Agency when external agencies exist — without recreating per-manager agencies

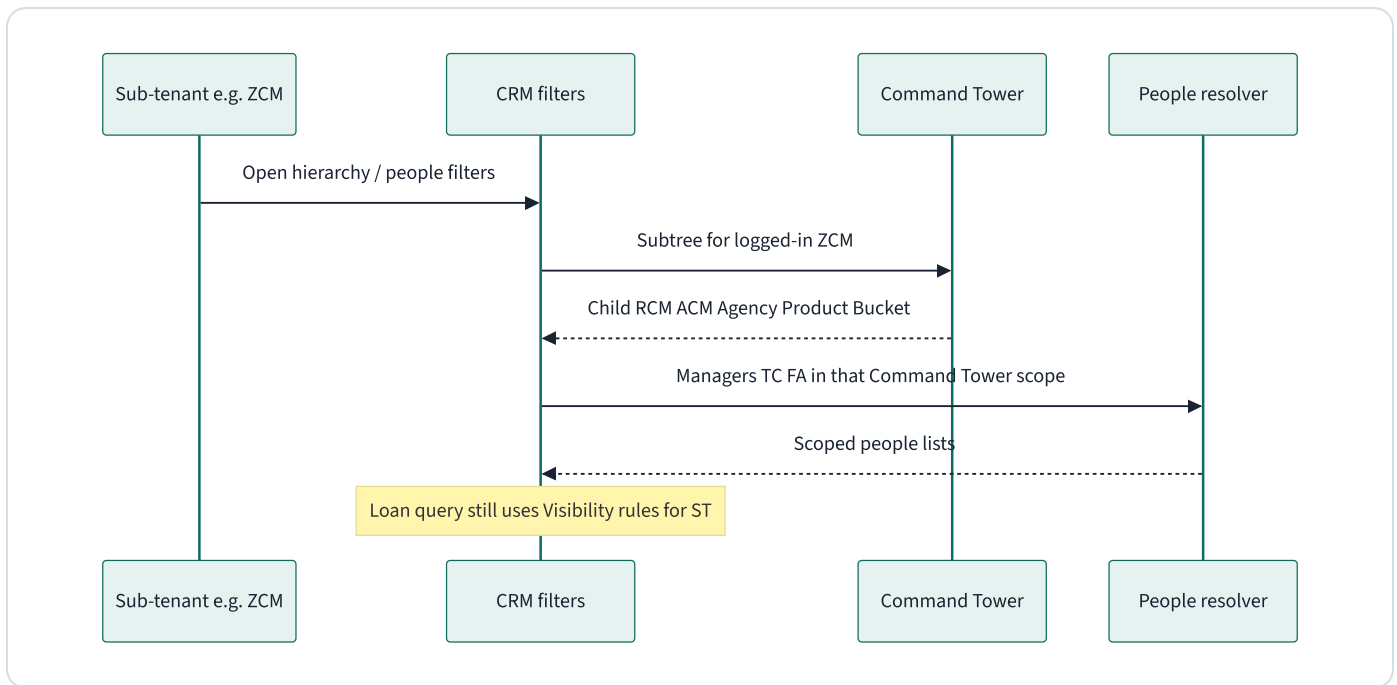

10.5 Assignment then collection

10.6 Manager opens TC / FA dropdown

10.7 Sub-tenant opens people / CM dropdowns

11. Phase-wise rollout into the system

Rollout is incremental so Godrej keeps operating while the interim agency model is retired.

Phase 0 — Align & inventory PREP

- Confirm roles, sample manager teams, product/bucket masters
- Inventory Command Tower usage vs portfolio/agency interim model
- Inventory APIs: loan list, dashboard, reports, mobile, settlement, integrations
- Agree Branch remains optional / unused at go-live

Phase 1 — Visibility foundation BUILD

- Visibility schema, resolver, cache, versioning, fail closed
- Excel upload → validate → preview → publish
- Visibility Admin screens in CRM
- Branch column present but non-mandatory

Phase 2 — Seed from current Godrej reality MIGRATE

- Generate workbook from: Self for TC/FA, Assigned Users for managers, Product+Bucket for managers who allocate, All Cases for primary admin

- Enrich CM/manager Command Tower rules from Command Tower Product/Bucket/Agency maps where applicable
- Dry-run publish; reconcile sample user case counts vs old behaviour

Phase 3 — Enforce on operational CRM CUTOVER

- Loan pages (list + detail), search/filters (multi-select $\cap$ visibility)
- Dashboards aggregates
- Assignment remains separate but only on visible loans
- Settlement list/approve scoped via loan visibility

Phase 4 — Mobile apps APPS

- Shared mobile APIs rewired to Visibility
- Field Agent Android + iOS: SELF; portfolio access demoted
- Manager Android + iOS: Assigned Users / dimension rules
- Coordinated app release with backend

Phase 5 — Reports, jobs, integrations hardening HARDEN

- MIS/report row security on Visibility
- Batch jobs that assume per-manager agency reviewed
- SMS / Payment / LMS posting: loan-id based; remove brittle portfolio assumptions
- LMS ingest: loan details only; Agency = Inhouse default; no per-manager agency side effects
- Agency Allocation page: ship for future external-agency moves (steady state = Inhouse)

Phase 6 — Retire interim hierarchy model RETIRE

- Stop creating agencies per manager for access
- Collapse to **Inhouse** as the default agency; use Agency Allocation only when external agencies exist
- Command Tower remains optional for org/reporting only
- Document steady-state onboarding SOP for Godrej ops

Parallel run: Phases 2–3 may briefly compare old vs new counts. Security authority switches to Visibility at the agreed cutover; interim agency model is then frozen for access.

12. Module-by-module implementation notes

MODULE	IMPLEMENTATION
Dashboard	All widgets query with Visibility Context; multi-select filters only narrow
Loan pages	List/detail/search enforce Visibility; remove portfolio membership as ACL
Loan assignment	Separate APIs; assignee stamp (TC/FA); manager assign limited to visible loans + permitted targets
Agency Allocation	New page; default Inhouse on LMS ingest; assign to external agency when Godrej brings one in — not from LMS
Reporting	Row scope = Visibility; formula changes only where business requires
Filters	Multi-select Product/Bucket/Agency/Assignee; Branch hidden until enabled; ∩ Visibility
Settlement	Create on visible loan; lists/approvals via Visibility + AuthZ
SMS / Payment	Trigger from allowed loan actions; callbacks by payment/loan id
LMS	Loan details only; no agency allocation from LMS; Inhouse default in Collektio; no per-manager agency side effects
Command Tower	Seed + reporting reference; not runtime ACL
